MERN STACK DEVELOPMENT REPORT

Week 5 : Component Architecture & JSX

Muneeb Ur Rehman

MERN STACK INTERN

Week 5 — Day 1

Component Architecture & JSX

Study Topics

- Setting up a React environment with Vite vs Create React App (CRA)
- JSX syntax and rendering elements
- Differences between Functional and Class components

Task

Bootstrap a new React application using Vite. Build a static landing page broken into distinct components (Header, Hero, Footer). Pass basic string data into these components using props.

Files / Components Created

- `src/components/layout/Header.jsx` — receives a `siteName` string prop
- `src/components/layout/Hero.jsx` — receives `title/subtitle` string props
- `src/components/layout/Footer.jsx` — receives `year/companyName` string props
- `src/pages/Home.jsx` — assembles the components into the landing layout
- `src/App.jsx` — renders Header/Footer as the shared page frame

Key Concepts Applied

- Functional components as plain JS functions returning JSX
- Passing data down via props instead of hardcoding text in each component
- Vite as the dev server/bundler (`vite.config.js`, `index.html` as the entry point)

Screenshot

Home page showing the Header, Hero, and Footer components rendering with prop data.
